

Edviron Revenue Analytics

Revenue, Commission & Settlement Analytics — Power BI Assignment

Explanation Note | Data Analyst Assignment | March 2026

746.36M

Total GMV (INR)

151.59K

ERP Revenue (INR)

201.67K

Edviron Gross Revenue

50.08K

Edviron Net Revenue

SECTION 1 — Revenue Logic Explanation

Edviron's payment platform operates on a **three-layer pricing model**. Every transaction processed through the platform passes through three distinct pricing tiers, each generating a different revenue stream.

Layer	Party	Definition	Role
Layer 1	Edviron Buying Price	Rate at which Edviron buys payment gateway processing	Cost to Edviron
Layer 2	Partner Pricing (ERP)	Rate at which Edviron sells processing to ERP partners	Edviron sells to ERP
Layer 3	Merchant Pricing (School)	Rate at which ERP sells processing to schools	ERP sells to schools

Revenue Formulas Applied Per Transaction:

ERP Revenue	= Merchant Pricing (INR) – Partner Pricing (INR)	Revenue earned by ERP/school from each transaction
Edviron Net Revenue	= Partner Pricing (INR) – Edviron Buying (INR)	Edviron's own margin per transaction
Edviron Gross Revenue	= ERP Revenue + Edviron Net Revenue	Also equals: Merchant Pricing – Edviron Buying

Settlement Flow: Payment Gateway collects the full Transaction Amount from the student and remits it entirely to Edviron. Edviron then settles the ERP's share (Merchant Pricing INR) and retains its own gross revenue.

SECTION 2 — Key Assumptions Made

A1	Status Normalisation: Raw data contained mixed case values ('success' and 'SUCCESS'). All status values were standardised to uppercase. All 48 transactions in the dataset have STATUS = SUCCESS — no failed or pending transactions exist.
A2	Pricing Type — FLAT: When Merchant Pricing Type, Partner Pricing Type, or Edviron Buying type = 'FLAT', the numeric value is used directly as the INR amount per transaction. Example: 2.0 FLAT = INR 2.00.
A3	Pricing Type — PERCENT: When type = 'PERCENT', the value is treated as a decimal fraction. Formula applied: Value / 100 x Transaction Amount. Example: 0.01 PERCENT on INR 14,165 = INR 1.42.

A4	Numeric Values in Type Column: Several rows in the dataset store a numeric value directly in the 'Edviron Buying type' column (e.g. 6.3, 17.145, 33.3675). These are treated as pre-computed absolute INR amounts, not as FLAT or PERCENT rates. This was confirmed by cross-checking with transaction amounts.
A5	NULL / Missing Pricing: 3 rows (Order IDs: SMED0000000374, SMED0000000383, SMED0000000385) have NULL values for Merchant Pricing and Partner Pricing. These were defaulted to INR 0.00 and flagged as 'MISSING PRICING' exceptions.
A6	Gateway Fee Computation: Gateway Fee per transaction is inferred as: Transaction Amount - Order Amount. For UPI transactions this consistently yields INR 2.36. For credit card transactions the fee is higher (varies by gateway).
A7	Capture Status: The Capture Status column is entirely NULL across all rows. All transactions are therefore treated as fully captured and settled.
A8	Duplicate Order IDs: Two Order IDs appear more than once in the dataset. Each row is treated as a distinct settlement record and retained in the analysis.

Dashboard Design Rationale & Business Insights

Revenue, Commission & Settlement Analytics — Power BI Assignment

SECTION 3 — Dashboard Design Rationale

The dashboard was designed following a **top-down information hierarchy** — executive summary at the top, supporting detail below. The single-page layout ensures all critical metrics are visible without scrolling, following Power BI UI/UX best practices.

KPI Cards — Top Row	8 KPI cards placed at the top give instant visibility to the most critical numbers: Total GMV, ERP Revenue, Edviron Gross Revenue, Edviron Net Revenue, Avg Payment Frequency, Total Transactions, Unique Users, and Pending Exposure. Evaluators see key numbers in under 3 seconds.
Slicers — Left Panel	All 4 mandatory slicers (Date Range, Partner, Gateway, Payment Method) are placed on the left side panel. This follows the standard Power BI navigation pattern where filters are always visible and accessible. All visuals dynamically update via DAX filter context — no manual filtering.
Monthly Trend — Line Chart	A dual-axis line chart shows ERP Revenue and Edviron Net Revenue over time by YearMonth. This visual directly addresses the assignment requirement for time-based trend analysis and helps identify revenue patterns across months.
Gateway Bar Chart	A horizontal bar chart compares Edviron Gross Revenue by Gateway (CASHFREE vs EDVIRON_EASEBUZZ). CASHFREE generates INR 195.96K vs EDVIRON_EASEBUZZ at INR 5.70K — a clear business insight on gateway performance.
ERP Name Bar Chart	A clustered bar chart shows ERP Revenue and Edviron Net Revenue by ERP Name (SparkIT, Yahweh, CampusPro, Akira). This reveals that Akira has negative Edviron Net Revenue (-INR 184.21K), a critical exception requiring business attention.
Payment Method Donut	A donut chart shows transaction distribution by payment method. UPI dominates at 86.63% (108,852 transactions), confirming Edviron's platform is UPI-first. Credit Card at 8.26% is the second-largest method.

SECTION 4 — Report Pages Structure

Page	Name	Key Visuals & Purpose
Page 1	Main Dashboard	8 KPI cards, 4 charts, 4 slicers — executive summary of all metrics
Page 2	Time Summary	Monthly & weekly revenue tables, monthly trend line chart
Page 3	Partner Performance	GMV by partner, revenue split chart, detailed institute-level table
Page 4	Gateway & Payment	Gateway volume comparison, payment method mix, success rate analysis

SECTION 5 — Key Business Findings

- **UPI Dominance:** 86.63% of all transactions use UPI. This confirms Edviron's platform is UPI-first and aligns with India's payment ecosystem trend.
- **Negative Net Revenue — Akira:** Akira ERP shows Edviron Net Revenue of -INR 184.21K. Edviron's buying cost exceeds what it charges Akira — a margin compression issue requiring commercial review.
- **CASHFREE Outperforms:** CASHFREE processes significantly higher GMV (INR 722.67M) vs EDVIRON_EASEBUZZ (INR 23.69M), making CASHFREE the dominant gateway by volume.
- **Missing Pricing Rows:** 3 transactions (SMED Order IDs) have no pricing data — these represent unreconciled exposure. Finance team should follow up with the Akira ERP partner.
- **ERP Revenue Concentration:** SparkIT generates the highest ERP Revenue (INR 216.54K) while Akira shows negative ERP revenue (-INR 184.21K), indicating highly uneven partner performance.

SECTION 6 — Bonus Features Implemented

Bonus Feature	Implementation	Location
Exception Flagging	Flag_Exception column auto-tags NEGATIVE ERP MARGIN, NEGATIVE NET MARGIN, MISSING PRICING on every row	Power Query + Page 5
Automated Reconciliation	Amt Payable to ERP vs Amt Retained by Edviron computed per transaction and summarised by partner	Page 5 Settlement Table
Modular DAX Measures	13 DAX measures using only column references zero hardcoded values anywhere in the model	Data Model
Power Query M Code	All transformations done in Power Query Raw data never manually edited	Power Query Editor
Negative Margin Count	DAX measure counting all exception rows for quick exception monitoring	Page 5 KPI Card
Clear Filters Button	Reset button placed on every page for easy one-click filter clearing	All 5 Pages
